

More than ever before, scientific research is revealing the fact that premature aging and disability are largely the result of our lifestyle. Poor eating habits, using harmful substances, and not getting enough sleep or exercise can make us old before our time. Several large research studies, including the well-known Alameda County Study¹ and the Adventist Health Studies² continue to reveal a clear relationship between the health habits listed below and one's risk of death. Individuals practicing all of these healthy habits may influence their longevity by nearly 30 years.

Recommendations

Maintain Your Blood Glucose Levels

Your Blood Glucose level is high/low. Stable blood glucose prevents complications, boosts energy, and supports overall health. Balanced eating and exercise help keep it in check!

Eat a good breakfast daily

Breakfast boosts your metabolism, helps you concentrate and perform better at school and work. It also aids in maintaining a healthy weight.

Avoid snacking.

For many people, snacking adds an average of 580 calories per day. Snacking impairs digestion, may disturb blood sugar control, and disrupt sleep. It also contributes to weight gain (3500 calories = 1 pound).

Enjoy more fruits and vegetables

These foods are packed with phytochemicals, vitamins, nutrients, and fiber. They are also lower in calories than other foods.

Increase whole grain intake.

Whole grains contain many important nutrients (fiber, B vitamins, and minerals).

Eat more nuts

Nuts are an excellent source of protein and good fats. They also help control blood sugar levels.

Avoid red meat

Eating red meat has been associated with type 2 diabetes, coronary heart disease, stroke and certain cancers.

Keep Blood Pressure Under Control

Your Blood Pressure level is high/low. Maintaining healthy blood pressure reduces risks of heart disease, strokes, and kidney problems. Regular exercise and a balanced diet can make all the difference!

Exercise Regularly

Exercise boosts energy, improves mood, improves cholesterol levels, lowers blood pressure, promotes sound sleep, enhances immune function, helps control blood sugar, and more!

Achieve a healthy weight

BMI between 18.5 - 24.9; your BMI is: • Waist circumference less than 40 in or 102 cm (men) • Waist circumference less than 35 in or 89 cm (women)

Get 7-8 hours of good sleep each night.

Sleep is important for our memory, learning, metabolism, and immune system.

Stop smoking

Smoking harms every organ of the body, increasing the risk of various cancers, heart disease, COPD, asthma, and dental problems.

Do not drink alcohol

Alcohol use can lead to the following problems: neurological, cardiovascular, psychiatric, social, and increases the risk of cancer and liver disease.

Increase spirituality

Those who have faith in God may have improved mental health and immune function.
